

Generic X-Y Plotting

Description

Generic function for plotting of `R` objects. For more details about the graphical parameter arguments, see [par](#).

For simple scatter plots, [plot.default](#) will be used. However, there are `plot` methods for many `R` objects, including [function](#)s, [data.frames](#), [density](#) objects, etc. Use `methods(plot)` and the documentation for these.

Usage

```
plot(x, y, ...)
```

Arguments

- `x` the coordinates of points in the plot. Alternatively, a single plotting structure, function or *any R object with a plot method* can be provided.
- `y` the y coordinates of points in the plot, *optional* if `x` is an appropriate structure.
- `...` Arguments to be passed to methods, such as [graphical parameters](#) (see [par](#)). Many methods will accept the following arguments:

`type`

what type of plot should be drawn. Possible types are

- "p" for **p**oints,
- "l" for **l**ines,
- "b" for **b**oth,
- "c" for the lines part alone of "b",
- "o" for both 'overplotted',
- "h" for 'histogram' like (or 'high-density') vertical lines,
- "s" for stair **s**teps,
- "S" for other **s**teps, see 'Details' below,
- "n" for no plotting.

All other types give a warning or an error; using, e.g., `type = "punkte"` being equivalent to `type = "p"` for S compatibility. Note that some methods, e.g. [plot.factor](#), do not accept this.

`main`

an overall title for the plot: see [title](#).

`sub`

a sub title for the plot: see [title](#).

`xlab`

a title for the x axis: see [title](#).

`ylab`

a title for the y axis: see [title](#).

`asp`

the y/x aspect ratio, see [plot.window](#).

Details

The two step types differ in their x-y preference: Going from $(x1,y1)$ to $(x2,y2)$ with $x1 < x2$, `type = "s"` moves first horizontal, then vertical, whereas `type = "S"` moves the other way around.

[plot.default](#), [plot.formula](#) and other methods; [points](#), [lines](#), [par](#).

For X-Y-Z plotting see [contour](#), [persp](#) and [image](#).

Examples

```
require(stats)
plot(cars)
lines(lowess(cars))

plot(sin, -pi, 2*pi) # see ?plot.function

## Discrete Distribution Plot:
plot(table(rpois(100, 5)), type = "h", col = "red", lwd = 10,
      main = "rpois(100, lambda = 5)")

## Simple quantiles/ECDF, see ecdf() {library(stats)} for a better one:
plot(x <- sort(rnorm(47)), type = "s", main = "plot(x, type = \"s\")")
points(x, cex = .5, col = "dark red")
```
